Spam filtering on Linux servers delivers high performance

Kosice-Slovakia, November 23, 2007. COMDOM Software has announced new partnerships with the two leading providers of Linux based server operating systems, Redhat and Novell. These partnerships demonstrate yet another significant advantage of deploying Linux based operating systems on the server infrastructure of large enterprises and ISPs.

“These partnerships let our customers know that we will work with Redhat and Novell to ensure enterprise wide compatibility in our products” said Peter Kosik, a senior software developer at COMDOM Software. Patrik Ostrihon, Chief Technical Officer pointed out, “when we remember that over 90% of all emails are spam, the need for fast and accurate processing of this noise is obvious. COMDOM Antispam, running on Redhat or Novell servers filters spam many times faster than any other combination. The optimization of our products allows enterprises and ISPs to handle the same volume of traffic on fewer machines, reducing the hardware and administrative costs.”

A free trial version of COMDOM Antispam for Servers is available at www.comdomsoft.com for a variety of Linux-based platforms.

COMDOM Antispam is a high capacity platform designed for the requirements of ISPs and other large organizations facing spam from the increasingly complex interconnections to the internet. COMDOM is a powerful Antispam system operating as a stand alone mail gateway with relay control, authentication and load balancing support. The system consequently can be used together with mail servers or as a stand alone gateway for several mail servers. The robustness, flexibility, and the high data throughput capacity of COMDOM Antispam reduce the costs of spam on hardware, software, and administration of network infrastructure.

About COMDOM Software

COMDOM Software develops security solutions for the digital economy. Our objective is to provide innovative and effective software for fighting spam, viruses and malware slowing the growth of integrated networks. COMDOM's developers have significant experience in building high performance network solutions. In the past they have cooperated with ESET on the development of the widely used NOD32 antivirus platform for Linux mail servers. ProWeb Consulting, a.s. COMDOM's sister company, also develops and supplies information systems for the Armed Forces of the Slovak Republic. COMDOM Software is a member of the ICSA Labs Antispam Consortium, an association of ten leading global companies focused on fighting spam.
